

HALLUCINATION

```
1s question = "Get me a list of students who were selected for internship at Goldman Sachs along with their CGPA"
print(qa_chain.input_keys)

result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.
Markdown(result["result"])
```

['query']

Here's a list of students selected for internships at Goldman Sachs along with their CGPA, based on the provided text:

- **Reethika Pogula:** CGPA: 7.62 (SWE Intern)
- **Aditya Sridasyam:** CGPA: 8.59 (Software Engineering Intern)

Here the RAG is hallucinating as the first name is correct but the second name is of someone who got into iCIMS. But their corresponding CGPA is correct.

```
question = "What topics of machine learning were asked in NVIDIA?"

result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.
Markdown(result["result"])
```

Based on the provided text, here's a breakdown of whether Machine Learning was asked about in the NVIDIA interviews, and a summary of the overall interview process:

Did NVIDIA ask about Machine Learning?

- **Yes, definitely.** The text explicitly mentions:
 - The candidate's PS1 deep learning project was discussed in detail.
 - Questions were asked about optimizing models and choosing appropriate metrics.
 - The candidate's NLP course assignment was discussed in detail.
 - The candidate's FoDS course assignments were extremely beneficial.
 - The project work the candidate completed for their PS-1 also allowed them to gain experience in ML-related disciplines and was a valuable addition to their resume.

Summary of the NVIDIA Interview Process (Based on the Text):

- 1. Group Discussion:**
 - Technology-related topic.
 - Speak for or against the topic.
- 2. Technical Interview 1:**
 - Resume-based questions, focusing on projects and internships.
 - Follow-up questions (technical and HR-related).
 - Questions about DBMS and data science concepts (related to the PS1 deep learning project).
 - Moderate-level DSA question, elaborated upon to increase difficulty and relate to real-time coding issues.

Here too, it hallucinated as there was nothing related to machine learning in the selection process of NVIDIA, next I tried changing the question:

```
2s question = "was anything related to machine learning asked in NVIDIA?"

result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.
Markdown(result["result"])
```

Based on the provided text, here's a breakdown of whether Machine Learning was asked about in the NVIDIA interviews, and a summary of the relevant information:

Yes, Machine Learning was asked about in the NVIDIA interviews, but not as heavily as DSA.

Here's the evidence:

- **PS1 Deep Learning Project:** The candidate mentions being questioned about their "PS1 deep learning" project, indicating that Deep Learning and related concepts were discussed.
- **Model Optimization and Metrics:** The text mentions questions about "problem-solving (what portion of the model would you optimize in a particular scenario) as well as questions regarding which metrics should be utilized when." This clearly indicates questions related to Machine Learning model optimization and evaluation.
- **NLP Course Assignment:** The candidate chose to explain an NLP course assignment, and the interviewer "quizzed me on certain machine learning concepts."
- **Not a Primary Focus:** The candidate notes that "proficiency in DSA is always advantageous" and that "machine learning concepts were required" for NVIDIA, but "this was not the case for other companies with data science responsibilities, such as Microsoft." This suggests that while ML knowledge was important, DSA skills were prioritized.

In summary, while DSA was a major focus, the NVIDIA interviews did include questions about the candidate's Deep Learning project, model optimization, relevant metrics, and general Machine Learning concepts, especially in the context of NLP.

GOOD DETAILED RESPONSE

```
✓ 5s [32] question = "what kind of questions were asked in Google in each round "
```

```
result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.  
Markdown(result["result"])
```

🔄 Okay, I've compiled the information from your provided text to give you a breakdown of the types of questions asked in Google interviews, based on the experiences you shared. It seems the interview process varies, but here's a general overview:

Round 1: Online Assessment/Test

- **Logic/Aptitude:**
 - Logical reasoning questions (scoring, didn't need much preparation, just careful reading).
 - Basic Mathematics questions
- **Coding:**
 - Program snippets in C: finding outputs and errors, understanding how changes would affect the code.
 - LeetCode medium level questions.
- **Computer Science Fundamentals:**
 - DSA (Data Structures and Algorithms): Fundamental questions. Trees were specifically mentioned.
 - OOPS (Object-Oriented Programming): Fundamental questions.
 - OS (Operating Systems): Fundamental questions, both practical and theoretical. Scheduling was specifically mentioned.
 - DBMS (Database Management Systems): Fundamental questions. Indexing was specifically mentioned.
 - Computer Networks (CN): Theoretical questions.

• HR:

- Computer Networks (CN): Theoretical questions.

• HR:

- Basic HR questions (mentioned in one account).
- **Important Considerations:**
 - Time pressure is significant. Speed is often rewarded.
 - Negative marking may be present.
 - Switching between sections may not be allowed.

Round 2: Coding/Technical Round(s)

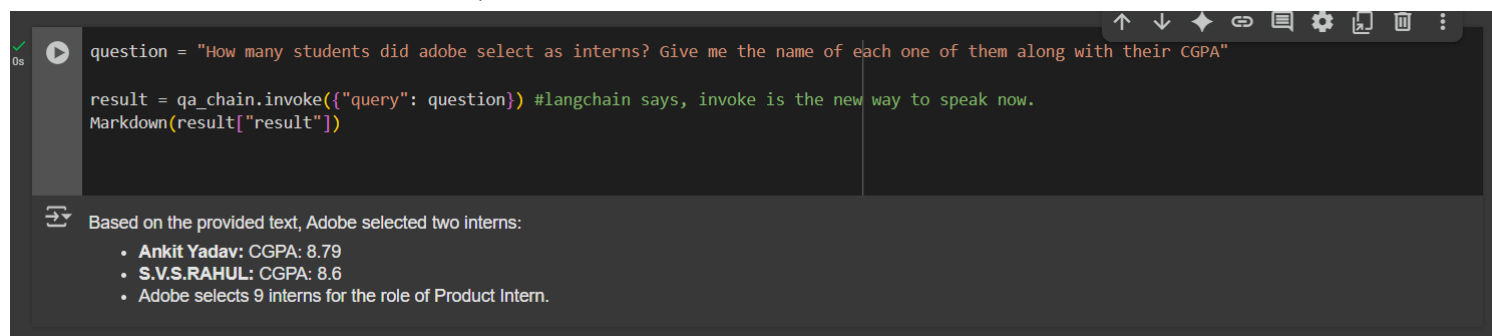

- **Coding:**
 - DSA problems: LeetCode medium level, often with a focus on optimization.
 - Standard algorithms and data structures: Maps, 2-pointers (e.g., 2-sum), priority queues, stacks, dynamic programming.
 - Optimization is key: Interviewers will likely ask you to improve your code's time and space complexity.
 - Coding in a shared document (e.g., Google Docs) is possible.
 - C program output prediction.
- **Technical Questions:**
 - Discussion of projects on your resume: Be prepared to explain your projects in detail, including the technologies used, your contributions, and design decisions.
 - Core electronics concepts (if applicable to the role): Digital design, Verilog, static timing analysis (ADVD).
- **Important Considerations:**
 - Solving quickly is important.
 - Interviewers may be friendly and offer guidance.

Round 3: Technical/Behavioral Round(s)

- **Technical Questions:**
 - In-depth discussion of projects: Expect to explain your projects in detail, including the technologies used, your contributions, and design decisions.
 - DSA problems.
- **"Googleyness":**
 - General thinking/problem-solving ability.

This was a particularly good response, it summarized everything said by all the candidates. Also I liked the fact that the model used the word “Googleyness” used by one of the students.

GOOD WITH NUMBERS, BUT INCOMPLETE RESPONSE

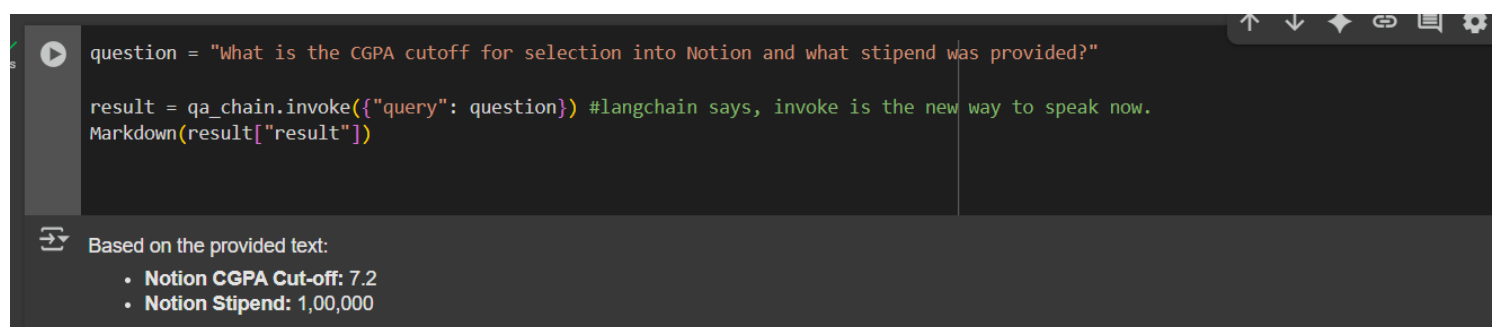

```
question = "How many students did adobe select as interns? Give me the name of each one of them along with their CGPA"

result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.
Markdown(result["result"])
```

Based on the provided text, Adobe selected two interns:

- **Ankit Yadav:** CGPA: 8.79
- **S.V.S.RAHUL:** CGPA: 8.6
- Adobe selects 9 interns for the role of Product Intern.

Here the fact that adobe selected 9 students is correct, but when I asked to go into more depth as I did in the first prompt, it gave incomplete response, but again the CGPA is correct.

```
question = "What is the CGPA cutoff for selection into Notion and what stipend was provided?"

result = qa_chain.invoke({"query": question}) #langchain says, invoke is the new way to speak now.
Markdown(result["result"])
```

Based on the provided text:

- **Notion CGPA Cut-off:** 7.2
- **Notion Stipend:** 1,00,000

Direct number question stated explicitly in the document is accurate.
